

DEAL SOURCING FOR EQUIPMENT FINANCE

High-intent leads for your account executives.

Quintel is a market intelligence engine that reads **millions of public filings** and surfaces the companies showing buying signals, matched to what your firm funds, while the equipment decision is still open.

July 2026

WHAT YOUR AES GET

Every call goes to a **name worth calling.**

A reason to call

Companies carrying a real buying signal in the public record: work won, a permit issued, a facility going up, financing running down. Not a list filtered by size and state.

Surfaced before anyone else

Signals reach your reps close to the day they hit the record, so the call happens before the same name shows up on the list every other funder bought.

Ranked by priority

Every company is scored on signal strength, corroboration across sources, and fit to what your firm funds. Your AEs start the day at the top of one list.

THE TIMING ADVANTAGE

 Signal hits the public record

Work is awarded, a permit lands, a filing ages toward its end

 **Quintel surfaces it, ranked**

Matched to your buy box, scored, with the evidence attached

 **Your AE calls first**

The conversation happens while they are still deciding how to pay for it

 **Later, the iron is on site**

Financed by whoever the dealer happened to walk them to

THE ENGINE

What you fund plus public signals, **synthesized into one list.**

WHAT YOU FUND

Your buy box

Sectors, ticket range, company size, geography, contact requirements. Set once with your team and tuned any time. Nothing surfaces that your firm could not write.

PUBLIC MARKET SIGNALS

Scattered across thousands of sources

Awards, permits, financing filings, expansions, fleet authority, market news. The buying intent is public, but no AE has time to find it across millions of records by hand.

WHAT YOUR TEAM GETS

A ranked, high-intent call list

One list, scored and explained, refreshed through the day as new signals land. Every row carries the trigger behind it and a link to the source document.

SIGNALS SCANNED CONTINUOUSLY

Federal & state contract awards

Construction permits

New fleet authority

Financing renewal timing

Facility expansions & new locations

Disaster recovery & infrastructure programs

State incentive awards

+ dozens more public sources

THE REPLACEMENT CYCLE

The equipment you didn't finance is **on a clock**.

The clock is public

When a business finances equipment, a UCC-1 goes on the state record: who lent, who borrowed, what date. Terms run two to five years.

That filing dates the moment the conversation reopens, and it has been sitting in the public record the whole time.

Today only the incumbent knows

Whoever wrote the paper knows when it matures and calls ahead of it. Everyone else finds out after the deal is re-papered, which is why renewals feel locked up.

They are not locked. Nobody is assembling the filings.

And you are calling a proven borrower

They needed equipment before. They were underwritten and approved before. They were financed by lenders writing the kind of paper your firm writes.

Two guesses come off every dial at once: whether they need it, and whether it can get approved.

Same engine, one more public record. Filings get read and ranked against your box alongside the permits, awards and expansions, so **renewal timing and new demand arrive on one list** rather than in two places.

GETTING STARTED

More funded deals from **the same dial count.**

STEP 1

Set your criteria

Sectors, ticket range, titles, contact requirements.
The engine only surfaces companies your AEs can actually write.

STEP 2

Put it on the phones

Your AEs work a live, ranked feed. We review what connected and retune together, so the list gets sharper every week.

STEP 3

Check the number every Friday

One page each week: who logged in, how many surfaced companies each AE contacted, and what came back. If a seat is not being used, you see it before we do.

The last one matters more than it looks. The risk with any tool bought for a sales floor is that it gets used for a month and then quietly stops, so **usage is reported to you rather than asked about.**
