D · User custody Who owns the wallet.	Customer self-custody wallets N The business customer controls keys.	Partner-controlled wallets N Business partner holds keys on behalf of its own end users (B2B2B). Policy-bound agent accounts N Owned by a business; AI agents operate within on-chain spending limits.

OPERATING RULES APPLIED ON EVERY PAGE

- 1 · Every

MTL

 leg sits inside the perimeter.

Fiat-to-stablecoin, stablecoin-to-fiat and fiat transmission run through Balance (US) or Netcoins Canada (CA).
- 2 · RebelFi is non-custodial.

Any routing that needs a custodial hop uses a licensed entity's wallet. RebelFi keys deploy and upgrade contracts only.
- 3 · Identity and money travel on separate paths.

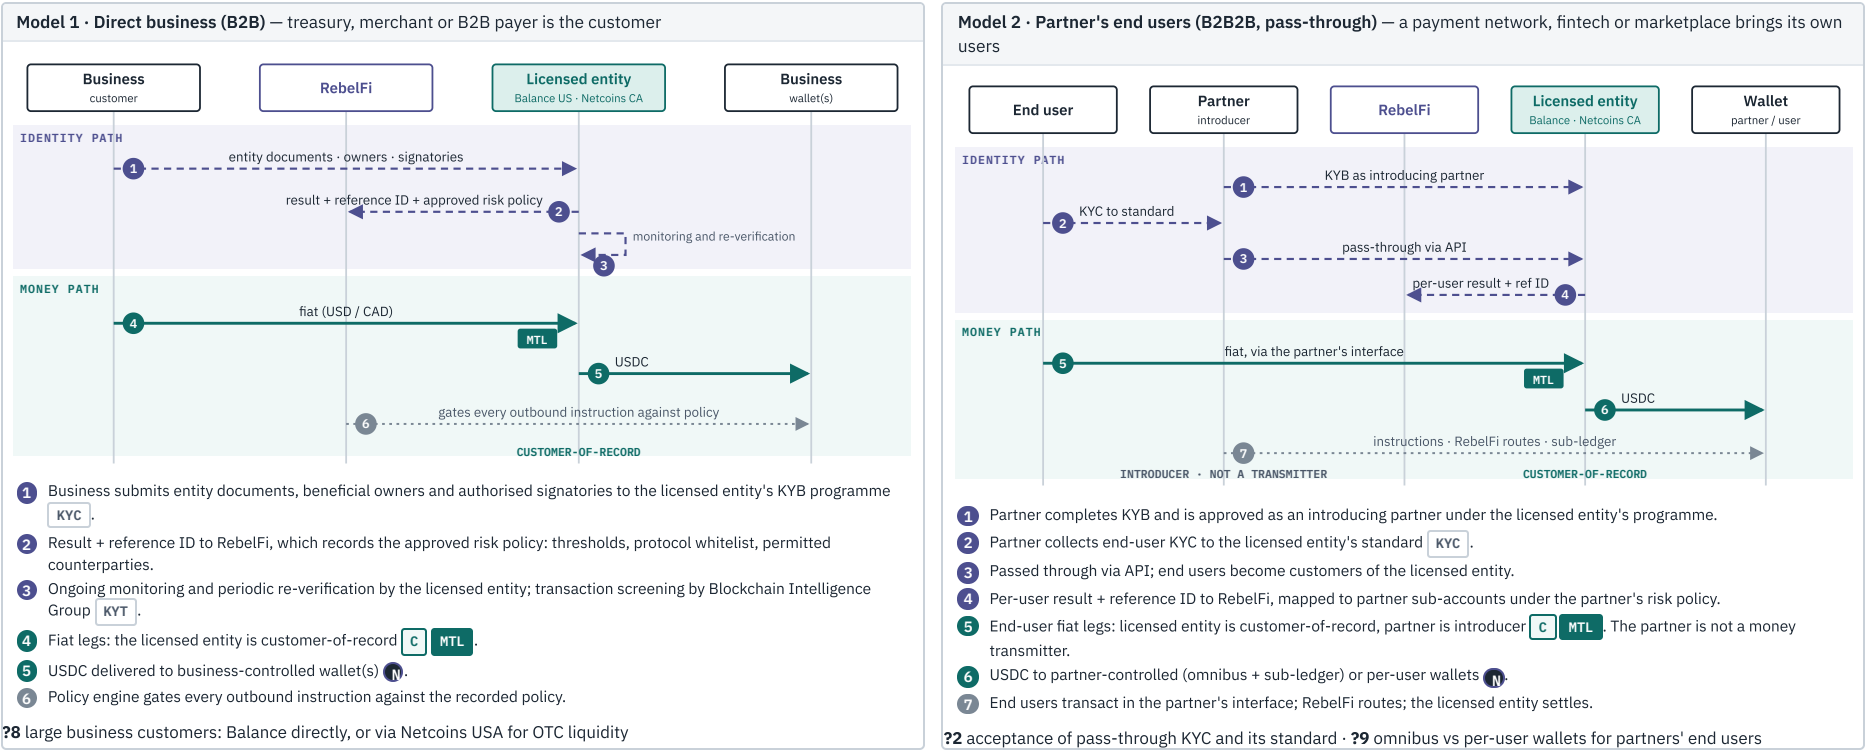

The licensed entity is customer-of-record for every money leg; RebelFi holds verification status and reference IDs, not documents.

Onboarding and KYC — customer-of-record

In both onboarding models the licensed entity is customer-of-record for every money leg, and identity data and money travel on separate paths. RebelFi receives a verification result and a reference ID, not documents. Screening on every flow is provided by Blockchain Intelligence Group. Grey dotted arrows are RebelFi instructions.

WHO HOLDS WHAT, AFTER ONBOARDING

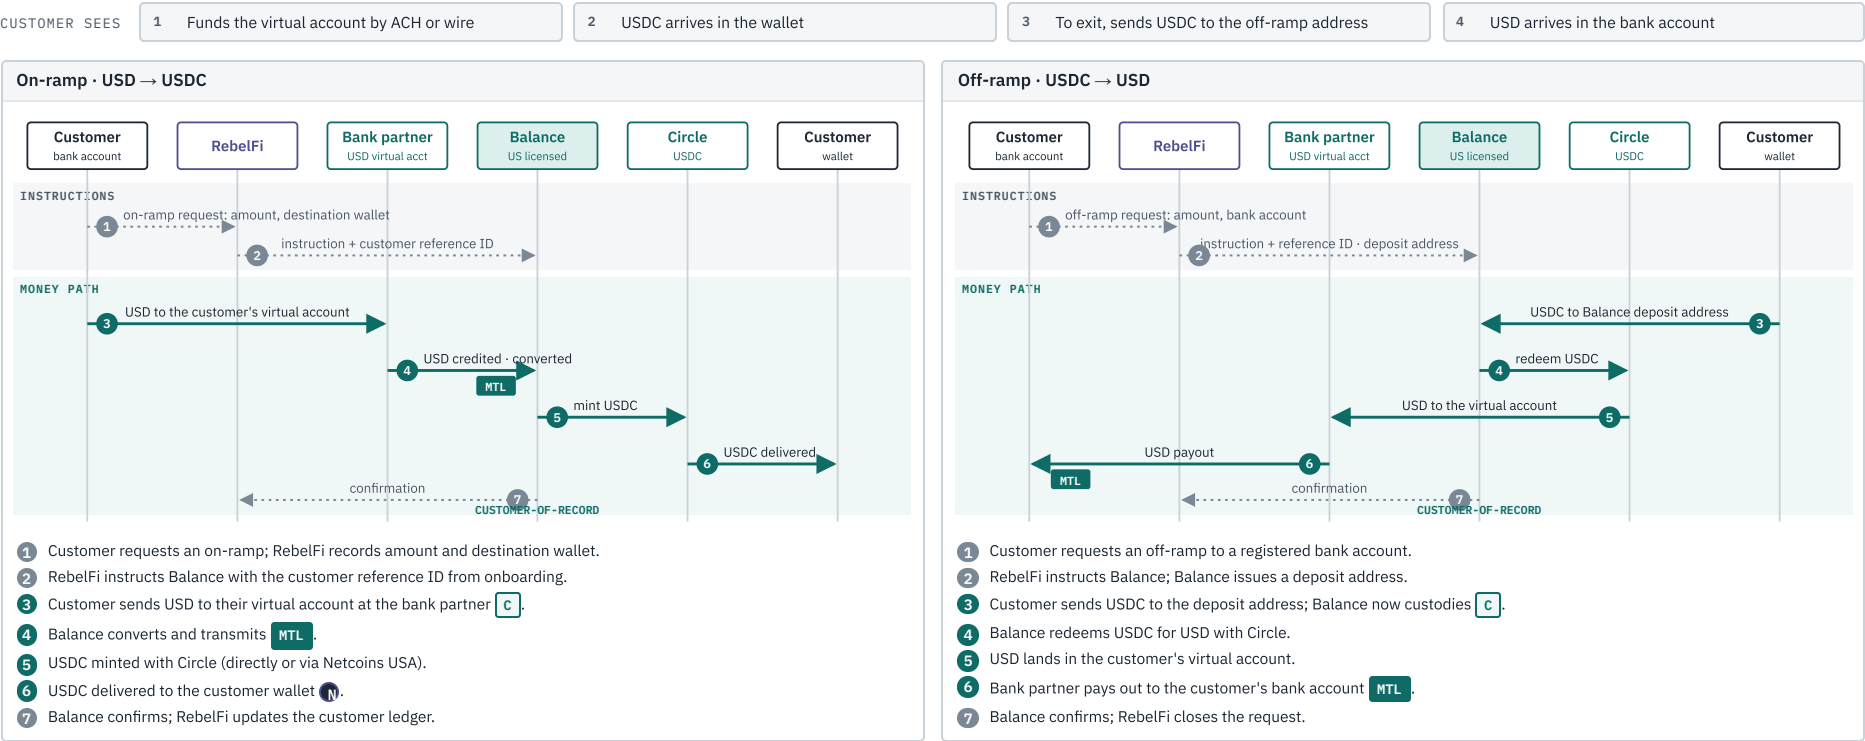

PARTY	HOLDS	DOES NOT HOLD
Licensed entity (Balance / Netcoins CA)	Identity documents, KYC/KYB file, customer-of-record relationship, fiat balances, monitoring obligations	Control over non-custodial wallets or on-chain positions
RebelFi	Verification status, tier, limits, reference IDs, the customer's or partner's risk policy, wallet mappings	Identity documents, fiat, customer funds of any kind
Customer / partner	Wallet keys; (partner) its end-user relationship and interface	Money-transmission obligations for the licensed legs

ASSUMPTIONS TO VALIDATE · OPEN ITEMS ADDED

?9	Omnibus vs per-user wallets for partners' end users	BIGG / Balance

On-ramp and off-ramp — the licensed legs

The two ends of every flow are the only legs that require a money-transmission licence. Fiat enters and leaves through a virtual account at the bank partner; Balance converts and transmits; USDC is minted or redeemed with Circle. Everything between the two ends is on-chain.

CUSTODY ALONG THE FLOW

STAGE	FUNDS HELD BY	PERIMETER
Fiat in the virtual account	Bank partner C	Inside
Conversion and transmission	Balance C MTL	Inside
Mint / redeem	Circle C	Inside; outside the group
USDC in the customer wallet	Customer N	Outside

Canada. Netcoins Canada performs both the banking and the licensed legs in CAD. Same sequence, one entity.

Yield on idle balances — no licensed leg

Idle USDC is deployed into whitelisted protocols under a per-customer risk policy. Funds move from the customer's wallet into on-chain positions the customer owns. No entity takes custody and no licensed leg is involved.

CUSTOMER SEES

1 Sets a risk policy, or accepts the partner default

2 Idle balance is deployed within policy

3 Accrual is visible; withdraw at any time

Deployment and withdrawal

Customer / partner
wallet

RebelFi
policy engine

Protocol
whitelisted · on-chain

INSTRUCTIONS

MONEY PATH

1 risk policy: thresholds, protocol whitelist, limits

2 evaluates idle balance against policy

3 proposed deployment, for approval

4 USDC into a position owned by the wallet

5 accrual

6 monitors venue risk · rebalances within policy

7 USDC returned on withdrawal

1 Customer or partner sets the risk policy; for B2B2B, the partner sets defaults per sub-account.

2 RebelFi evaluates idle balance against thresholds and the whitelist.

3 Proposed deployment goes to the wallet owner for approval, or executes automatically within pre-approved limits.

4 USDC moves into a protocol position owned by the wallet.

5 Accrual is tracked and attributed per wallet or sub-account.

6 RebelFi monitors venue risk and rebalances only within the policy.

7 On withdrawal, USDC returns to the wallet.

Policy options

OPTION	EFFECT
Approval thresholds	Amounts above the threshold require explicit approval
Protocol whitelist	Only named venues are eligible
Insured deposits	Restricts to venues with deposit cover
Sharia-compliant	Restricts to compliant venues and structures
Partner defaults	Applied across a partner's sub-accounts (B2B2B)
Treasury mode	Business balances swept above a floor, returned on demand

CUSTODY ALONG THE FLOW

STAGE	FUNDS HELD BY
Idle balance	Customer / partner wallet N
Deployed	On-chain position owned by the wallet N
RebelFi	Instructions only A

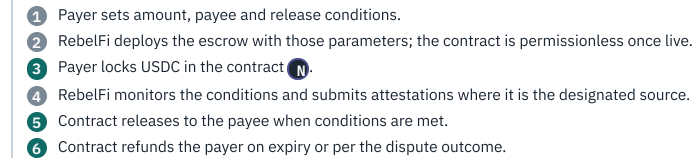

Yield is a feature applied to balances that already sit in a wallet; it does not change who holds the funds. Partner-level sweeps use the same sequence with the partner wallet as the owner.

Agentic payments — policy-bound agent accounts

An AI agent pays from a policy-bound account owned by a KYC'd business. The owner sets each agent's spending limit and the account enforces it on-chain, so a mistaken or compromised agent cannot overspend. **Agents never become customers:** the owner is customer-of-record, the agent is an operator on the owner's account, and fiat legs run through the licensed entity as on any other flow. Compatible with agent payment rails such as x402.

Controls

CONTROL	ENFORCED BY	STATUS
Per-agent spending limit	The account, on-chain	Existing
Pause all agents	Owner, instantly	Existing
Owner override	Owner acts without limits; agents cannot	Existing
Intent check before signing	Agent-side library	Existing
Escrow for work that takes time	Contract	Existing
Period limits and allowlists	The account	Next
Conditional release from escrow	Contract	Next

WHERE IT SITS

ITEM	POSITION
Customer-of-record	The owner (business), via the licensed entity
The agent	Operator on the owner's account; not a customer
Fiat in / out	On-ramp and off-ramp legs, unchanged
Screening	Blockchain Intelligence Group on every transaction KYT
Custody	Owner controls; RebelFi holds no keys A

AGENT PAYMENT RAILS

Rails such as x402 define how an agent pays a service. The account defines whether it may, and how much. The rail requests; the account authorises within the owner's limits; screening applies as on any flow.

?17	Target chain for redeployment of the account and escrow programs	BIGG / RebelFi

Cross-chain transfers and clean wallets — CCTP

USDC moves between chains by burn-and-mint through Circle's CCTP; no custodian holds funds in flight. A **clean wallet** (also known as a ring-fenced wallet) accepts only balances whose source passes screening, so everything inside it has a known origin.

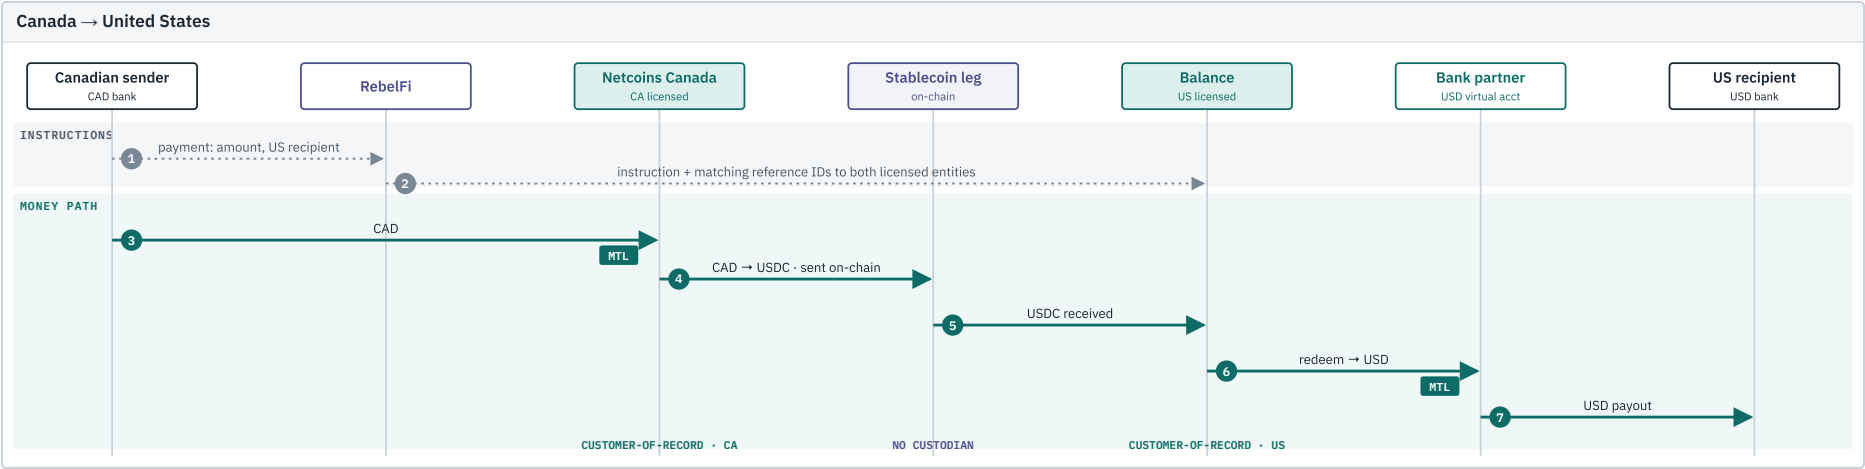

- CUSTOMER SEES
- 1 Chooses the destination chain
- 2 USDC is burned on the source chain
- 3 USDC is minted on the destination chain, within minutes

Cross-border Canada ↔ United States — two licensed legs, one stablecoin leg

A Canadian-dollar payment settles in US dollars by passing through both licensed entities with a stablecoin leg between them. Each entity handles its own domestic leg; the stablecoin leg in between has no custodian. The reverse runs the same sequence: Balance sends, Netcoins Canada pays out in CAD.

- CUSTOMER SEES
- 1 Canadian sender funds CAD and names the US recipient
- 2 USD arrives in the recipient's account
- 3 Reverse: US sender funds USD, CAD arrives in Canada

- 1 Sender creates the payment; RebelFi resolves the recipient to a US payout.
- 2 RebelFi instructs both licensed entities with matching reference IDs.
- 3 Sender funds CAD with Netcoins Canada C MTL.
- 4 Netcoins Canada converts CAD to USDC and sends it on-chain; CCTP if the chains differ.

- 5 Balance receives the USDC C.
- 6 Balance redeems to USD into the recipient-side virtual account MTL.
- 7 Bank partner pays out to the US recipient's bank account.

CUSTODY ALONG THE FLOW

STAGE	FUNDS HELD BY
CAD leg	Netcoins Canada C
Stablecoin leg	None in flight; wallet-to-wallet N
USD leg	Balance, then bank partner C

NOTES

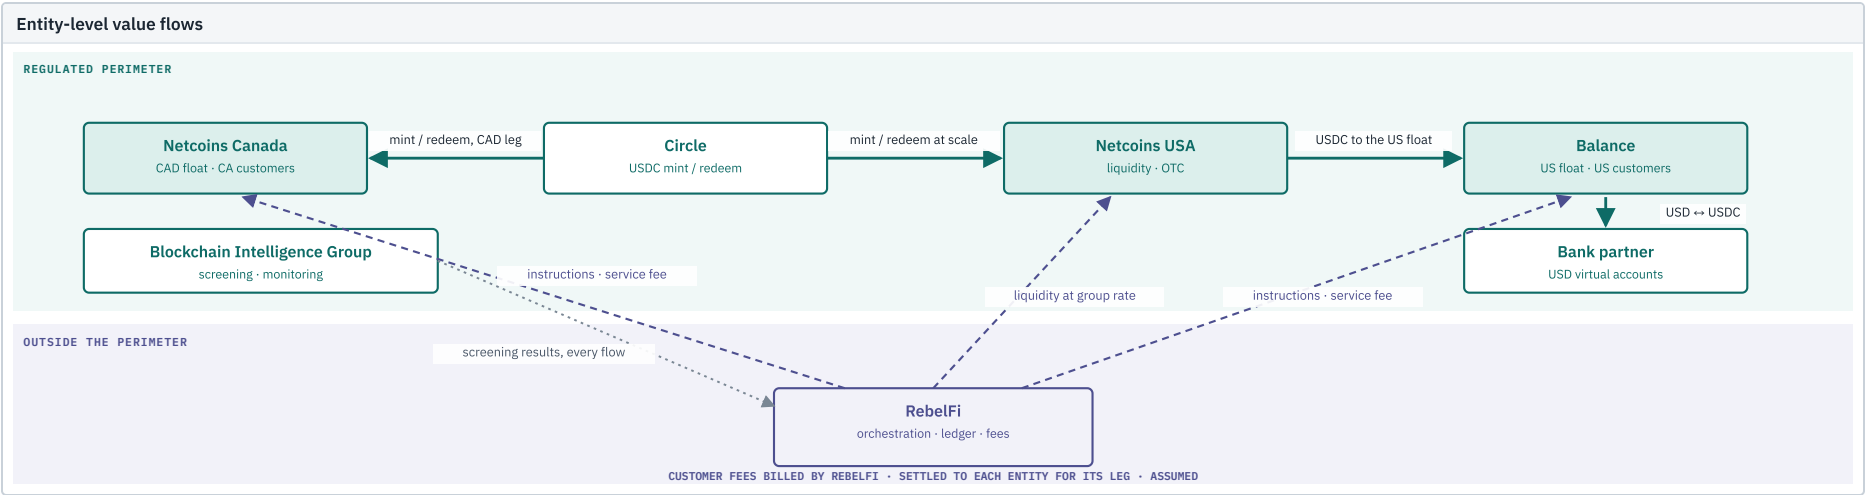

The FX rate is set at the CAD → USDC conversion. Timing is dominated by the two domestic legs; the stablecoin leg settles in minutes.
