

AICAP Validation MVP — Statement of Work

Prepared for: Stephanie Williamson, AICAP

Prepared by: Simon Pettibone, Tokenrip

Fee: \$12,000, less the \$1,000 discovery already paid, for \$11,000 net

Length: ~7 weeks from kickoff

Summary

Tokenrip would build the AICAP Validation MVP: an AI-assisted application completion workflow that helps providers produce complete, credentialing-ready applications with minimal manual effort.

A provider goes from the start of an application to a complete, credentialing-ready submission in a single guided pass. On submission the workflow produces two PDFs: the completed application and the audit trail. The engagement has a defined deliverable and a clean handoff; work beyond it is separately scoped.

Scope

The provider experience stays as AICAP designed it: the applicant sees only what they need to answer, guided to a complete, credentialing-ready application.

The five surfaces:

1. **Application autofill from provider-supplied inputs.** At the start of an application a provider usually has their CV and a government ID (driver's license or passport). The workflow extracts structured fields from those and pre-fills the application wherever the source is unambiguous, including identifiers that appear on the CV, such as an NPI or license number. For identifiers not in the documents, the DEA registration number, NPI, or license number, the provider supplies them in the guided flow. The provider sees an application already mostly populated, not a blank form. The exact input list is locked at kickoff.
2. **Context-aware field expansion.** When the CV implies a fact, for example faculty member at a named medical center, the workflow populates the adjacent fields (hospital affiliation, malpractice coverage, work-history scaffolding) instead of asking the provider to repeat what is already there.

3. **Automated compliance review.** Every field is checked against AICAP's compliance bar (the Joint Commission, CMS, and NCQA-relevant items AICAP provides), sorting items into compliance-ready versus needs-follow-up before any review begins. Requirements that vary by state or hospital stay configurable, so the bar can be set to a specific destination's rules.
4. **Provider review and confirmation.** Where the workflow has inferred or pre-filled an answer, it presents that answer for the provider to confirm, edit, or reject, a review step rather than a blank form. Only the provider confirms or edits their own information. Nothing is answered on their behalf, and nothing auto-submits. Whether this stays a distinct step or merges into the guided intake below is validated once the first three surfaces are running.
5. **Guided intake for the residual unknowns.** For anything the workflow could not infer at all, it asks the provider a short, targeted question rather than presenting a full form. Where the provider cannot resolve an item alone, for example verifying a prior affiliation, the workflow surfaces who can, such as the office manager at that prior practice. Any item still unresolved at submission is flagged for the credentialing coordinator, so on receipt they know an early task is to reach out for what is missing.

The admin view. The credentialing coordinator starts an application from a minimal admin view, which emails the provider a link. The provider completes the application through the surfaces above and attests, and on submission the two PDFs are generated and emailed back to the coordinator. The same view gives AICAP the visibility to run and debug the product it owns: the applications processed and their status, errors with their cause, and basic counts. It is there to operate the MVP, not to watch a queue for monitoring applications in progress; AICAP's team keeps working from the tools they use today.

A configurable core. The workflow is built once as a reusable core and configured against AICAP's requirements: forms, logo, application and attestation questions, state-specific forms, history windows (the seven and ten year variations), affiliation, malpractice, and distance rules. The MVP is built against one baseline configuration agreed at kickoff. Configuring it to a specific hospital's full requirements is part of that hospital's separately-scoped deployment.

Out of scope:

- Integration into a hospital's credentialing software. The MVP leaves a configurable space for it; the connection itself is a separate deployment.
- Per-hospital configuration beyond the one baseline.
- Live production use with real provider data. The MVP is built and accepted on de-identified samples; the security real data requires, the hospital's security requirements, and the AI provider's data terms belong to a pilot.
- Privileging.

Deliverables

- The AICAP Validation MVP: the working workflow above, accessible to AICAP, taking a provider from start to a complete, credentialing-ready application in one guided pass.
 - The provider intake and the admin view: start an application, the processed-application list with status and errors, basic counts, and access to the generated PDFs.
 - The two PDFs on each submission, the completed application and the audit trail, stored and emailed to the coordinator who started the application.
 - One baseline configuration, built against the requirements AICAP provides at kickoff.
 - A configurable space left open for a future integration into a hospital's credentialing software.
-

What AICAP provides

The build is configured against inputs only AICAP can supply: the compliance checklist (the Joint Commission, CMS, and NCQA-relevant items the workflow checks against), the baseline configuration requirements, the guided-question content that walks a provider to a compliant answer, and the de-identified sample applications to build and test against. The scoping call locks what is needed and when; the timeline assumes these arrive on schedule.

To start, the minimum is a 30-minute scoping call and three to five de-identified sample applications with their inputs. The MVP runs on example data, so it does not require a hospital partner or a signed pilot to begin.

Timeline

Seven weeks from kickoff, demo-driven, on real example applications throughout.

Week	What happens
0	Scoping call. Kickoff. Lock inputs, the baseline configuration, and the compliance-checklist scope.
1	Application autofill live on sample inputs (CV, ID, extracted and entered numbers), started from the admin view. Context-aware expansion calibrated.

Week	What happens
2	Automated compliance review calibrated against AICAP's checklist, configurability in place. Demo.
3	Provider review step and guided intake live. Demo.
4	Both PDFs generated end to end, emailed to the coordinator on submission. Demo.
5	Admin view operability: processed-application list, status, errors, basic counts. Full run on the sample set, unresolved items flagged for follow-up. Demo.
6	Iteration tail, edge cases. Demo.
7	Acceptance and handoff.

The weekly demos exist so AICAP can spot any slippage as it happens. Move the schedule either direction as needed.

Cost

\$12,000, less the \$1,000 discovery already paid, for **\$11,000 net**, due at kickoff.

Fully refundable through day 30: if the build is not on track by then, AICAP says so and the fee is returned in full, no questions asked. The weekly demos fall inside that window, so AICAP is judging real progress before it closes.

Ownership

AICAP owns the Validation MVP and everything specific to AICAP: the workflow, the application and credentialing logic, the compliance encoding, the configuration, the guided-question content, the generated output, the deployed instance, and anything derived from AICAP's inputs, including any component trained or tuned on AICAP's documents and data. On acceptance these are AICAP's outright. Nothing built from AICAP's inputs leaves with Tokenrip.

Underneath that sits Tokenrip's general-purpose document-handling technology, the extraction and processing components it brings to the work and reuses across projects, with nothing AICAP-specific in it. AICAP is free to use the version that ships with its build however and for as long as it wants, with no restrictions. Tokenrip keeps that underlying general technology to go on using and improving it for other work.

The result: AICAP has full ownership and control of the product and its IP, free to use everything in the delivered MVP, with no dependency on Tokenrip to run it.

Handoff

On acceptance, AICAP receives a working product it controls:

- The deployed Validation MVP, hosted and configured, that AICAP logs into and uses, including the admin view for running and debugging it. The hosting account is in AICAP's name.
- It runs on AICAP's own AI provider account (such as Anthropic). Tokenrip sets this up with AICAP and configures the workflow to use it, so usage and cost sit with AICAP and nothing depends on Tokenrip's accounts.
- The complete source and configuration for the AICAP-specific workflow, transferred to AICAP, so any engineer can run or change it later.
- Documentation: how to use the workflow, how to adjust the baseline configuration, and how the two PDFs are generated.
- A walkthrough so AICAP's team can operate it without Tokenrip.

The handoff is complete when AICAP can run the workflow, process an application end to end, and generate both PDFs without Tokenrip's involvement.

Acceptance criteria

The Validation MVP is accepted when, against a set of de-identified sample applications agreed at kickoff, it:

1. Extracts and pre-fills from a provider's CV and ID, including identifiers present in those documents, and collects the DEA, NPI, and license numbers not found in them.
2. Expands context-implied fields without re-asking the provider.
3. Reviews every field against the agreed compliance checklist and sorts compliance-ready from needs-follow-up.
4. Presents inferred answers for the provider to confirm or edit, with the provider as the only party confirming their own information.
5. Walks the provider through guided questions for the residual unknowns, surfaces a resource where one applies, and flags anything still unresolved for the credentialing coordinator.

6. From the admin view, lets the coordinator start an application and receive the two PDFs by email on submission, and gives AICAP the processed-application list with errors surfaced.
7. Produces, on submission, the completed application and the audit trail as two PDFs.

Acceptance is measured against the agreed sample set. Production hardening and live provider data are out of scope for the Validation MVP.

Future Opportunities

Both parties recognize that successful completion of the Validation MVP may create opportunities for future collaboration. Any future pilot deployments, integrations, production hardening, support arrangements, or additional product development would be separately scoped and governed by a new agreement. Nothing in this proposal obligates either party to enter into future engagements.
