AI-Credentialing Application Completion for Healthcare Systems

Validation MVP

Change:

Company name is AICAP - not AICAP Access

Summary Section

~~“Tokenrip would build the application completion platform AICAP Access has designed and prototyped: the layer that sits between application submission and primary source verification.”~~

Change to:

“Tokenrip would build the AICAP Validation MVP: an AI-assisted application completion workflow that helps providers produce complete, credentialing-ready applications with minimal manual effort.”

I would like the word “platform” removed - this is one slice of a platform, not the platform itself.

Please refer to as, “workflow”

I would like the phrase, “phase 1” removed.

Please replace with Validation MVP.

Please remove the words: platform, phase 1, system.

Please remove any references to future “phases”. As we discussed, I would like there to be a completed product of the validation MVP with a clear handoff. Any additional/future work would be separately scoped engagements. I would like to keep this scope/piece tightly contained.

The five product surfaces:

1. Most providers will have their CV and ID (drivers license or passport) available when they begin the application. The other documents described in item #1, are not required not usually available when they are completing the application. What is needed, are the license number, DEA registration number, NPI.

aicap-access.com

2. NAILED IT!

3. Is correct - there maybe specific state and/or hospital requirements where the optionally of configuration must remain open.

4. Who is the operator? The applicant? Is number 4, like an AI suggestion that the applicant confirms or rejects or edits? I am not sure this surface is needed. We can keep it in the proposal - and decide the best path forward when see the performance the first three surfaces. I would like clarification on who the operator is, I don't want to assume anything. If the operator is the credentialing coordinator and indicated in the Product Looks Like in Use section - the coordinator should not have any access to edit or confirm information on behalf of the provider.

5. This is correct, and in the final output any unresolved data should be flagged for the credentialing coordinator to follow-up. So if an office manager is provided, the coordinator, upon receiving the submission will know that one of their first tasks is to reach out to the office manager to obtain what is missing.

What the Product Looks like in Use:

There is no need for a dashboard - there is no AICAP monitoring or queue for credentialing coordinator to observe. Any monitoring would be done from their current monitoring system (ie: credentialing software, spreadsheet, email, handwritten list, or all of the above).

Credentialing coordinator triggers application link email to provider, with AICAP's link imbedded.

Provider logs in, works with AICAP to complete application.

MVP Validation: Upon submission - AICAP generates two PDFs: completed application and audit trail

Pilot: Upon submission - data is transferred to credentialing software + plus two PDF documents of completed application and audit trail.

"Landing in the hospital's system" should be reduced to the MVP validation will have have a opening or configurable space for integration into hospital's system. That is the containment for this scope.

Engagement Model for Hospital Sales Cycles:

aicap-access.com

I appreciate both of our intentions to enter into a long term professional relationship and the modes describing that collaboration. However, I think would be better suited for a document such as a Collaboration Intent Letter, Strategic Collaboration Engagement Statement or Design Partnership Understanding document.

Therefore I would like the “Engagement Model for Hospital Sales Cycles” changed to:

Future Opportunities

Both parties recognize that successful completion of the Validation MVP may create opportunities for future collaboration. Any future pilot deployments, integrations, production hardening, support arrangements, or additional product development would be separately scoped and governed by a new agreement. Nothing in this proposal obligates either party to enter into future engagements.

Both parties recognize that successful completion of the Validation MVP may create opportunities for future collaboration. Any future pilot deployments, integrations, production hardening, support arrangements, or additional product development would be separately scoped and governed by a new agreement. Nothing in this proposal obligates either party to enter into future engagements.

Additional Comments:

The Validation MVP Engagement should be limited to what I am buying. It should contain:

- Scope
- Deliverables
- Timeline
- Cost
- Ownership
- Handoff
- Acceptance criteria

Nothing else.

This becomes the proposal and eventually the SOW/contract.
